

Aegrail

Evidence-first security audits for web incidents

BRAND BOOK / STARTER IDENTITY SYSTEM

Evidence-first security audits for web incidents.

A protective evidence trail for logs, diffs, snapshots, admin activity, and database changes.

Aegrail = Aegis + Trail

A shield built from traces. A defensible timeline from evidence.

Name meaning

Aegis	shield, protection, defense
Trail	audit trail, evidence trail, incident trail

Positioning

Aegrail protects by watching evidence, not guessing. It collects logs, snapshots, diffs, file changes, admin activity, and database changes, then turns them into a defensible incident timeline.

Core message

- Evidence-first: do not start from assumptions or generic alerts.
- Traceable: every conclusion links back to a file, log, diff, snapshot, user action, or database change.
- Defensible: the output is useful for incident review, client reporting, remediation, and stakeholder explanation.

Primary logo system

Aegrail

Evidence-first security audits for web incidents

Horizontal lockup

Stacked lockup

Mark

App icon

Aegrail

Wordmark

Use the logo with space and contrast

The mark must remain readable at dashboard, CLI, documentation, and favicon sizes.

Clear space

Keep at least one node diameter around the mark.
Do not crowd it with copy, badges, or UI chrome.

Aegrail

Evidence-first security audits for web incidents

Dark backgrounds

Use the white wordmark version on midnight, blue, or dark product surfaces.

Small sizes

Use the app icon or simplified mark below 64px.
Avoid the full tagline in small UI placements.

Avoid

- Do not stretch or compress the shield.
- Do not replace cyan/teal with random warning colors.
- Do not add padlocks, skulls, or generic hacker motifs.
- Do not place the navy wordmark on dark backgrounds.

Prefer

- High contrast, generous whitespace, and clean grids.
- Use the trail/node motif for timelines, diffs, and traceability.
- Use cyan for active evidence, teal for verified trail, green for integrity/OK.
- Use red only for confirmed malicious/high-severity signals.

Color palette

Dark forensic base, bright evidence accents, restrained neutral UI support.

Midnight Navy
#0B0F1A

Deep Blue
#0F1E3A

Aegis Blue
#126DFF

Cyber Cyan
#00E5FF

Trail Teal
#00BFAE

Evidence Green
#78FF82

Cool Gray
#A6B0C3

Mist Gray
#E6E9EE

Paper
#F6F8FA

Alert Red
#FF4D5E

Color roles

- Midnight Navy and Deep Blue are the primary product surfaces and serious security base.
- Cyber Cyan is the active evidence signal: selected nodes, live scan paths, highlighted diffs.
- Trail Teal is the verification/trust trail. Evidence Green is reserved for integrity OK, pass, sealed, verified states.
- Cool Gray and Mist Gray support readable tables, metadata, dividers, and secondary text.

Typography and tone

Evidence first. Security always.

Use a clean neo-grotesk sans for product and marketing surfaces. Recommended families: Inter, IBM Plex Sans, Avenir Next, or Segoe UI.

```
$ aegrail scan --target example.com
```

Scan complete: 1,248 items

Diff: +12 -4 across 3 files

Use a monospace accent for CLI, checksums, paths, diffs, timestamps, and immutable IDs.

Voice rules

- Lead with evidence, not fear.
- Prefer precise verbs: collect, correlate, diff, verify, seal, export.
- Keep incident language calm: clear, chronological, defensible.
- Avoid vague claims like “AI-powered magic” or “guaranteed breach detection.”

Product language

- Evidence item
- Baseline snapshot
- File change
- Code diff
- Admin activity
- Database change
- Audit checkpoint
- Incident timeline

Messaging pillars

Aegrail should sound like a calm forensic system, not an alarm siren.

Evidence-first

We start with verifiable evidence, not assumptions. Every action is backed by reproducible data.

Defensible timeline

Chronological, ordered, and clear. Reconstruct every step with confidence.

Trace every change

Detect, diff, and attribute changes across the web stack and content.

Web incident response

Purpose-built for speed, accuracy, and reporting when it matters most.

Messaging formula

Evidence collected -> changes correlated -> timeline verified -> report exported. This phrase structure is a good foundation for landing pages, docs, CLI output, and stakeholder decks.

Incident timeline as the core visual metaphor

Logs, diffs, snapshots, admin activity, and database changes become a defensible timeline.

Incident Timeline

Immutable. Ordered. Defensible.

UI rules

- Use timeline nodes for evidence states, not decoration.
- Use clear labels: file path, time, actor, affected resource, checksum, row count.
- Keep severity distinct from verification. A verified event may still be benign.
- Make export/reporting feel like sealing the evidence trail.

CLI examples

The CLI should be short, predictable, and evidence-oriented.

```
>_ aegrail scan  
>_ aegrail diff  
>_ aegrail report
```

Command families

- scan - collect evidence from a target.
- diff - compare current state against a baseline.
- report - export a stakeholder-ready incident report.
- seal - optional future verb for finalizing/checkpointing a timeline.

Recommended output style

Prefer concise, auditable output: timestamps, target, evidence count, changed files, checksum IDs, warnings, and report path. Avoid noisy progress bars in logs where structured output is expected.

Asset index

This package includes editable vector files, PNG exports, tokens, favicon files, and concept boards.

SVG vector assets

- logos/svg/aegrail-mark.svg
- logos/svg/aegrail-horizontal-navy.svg
- logos/svg/aegrail-horizontal-white.svg
- logos/svg/aegrail-stacked-navy.svg
- logos/svg/aegrail-app-icon.svg

PNG exports

- logos/png/mark/
- logos/png/horizontal/
- logos/png/stacked/
- logos/png/app-icon/

Web/dev tokens

- tokens/aegrail-colors.css
- tokens/aegrail-colors.scss
- tokens/aegrail-colors.json
- tokens/tailwind.aegrail.extend.js

Favicons

- favicon/favicon-16x16.png
- favicon/favicon-32x32.png
- favicon/apple-touch-icon.png
- favicon/icon-512.png

Production note

The symbol is fully vector. The wordmark uses editable SVG text for easy iteration; for final public launch, convert the wordmark to outlines in Figma/Illustrator and run trademark/legal clearance.
